That's great! That means results are more likely to represent worst-case and to be responsive to community concerns for folks who already cleaned up stuff before our guidance was out.

**Subject:** Re: Activity Base Sampling Photos

The area they are sampling had yet to be cleared as of this morning and there was visible debris today.

Richard,

I just wanted to clarify whether this activity-based sampling is being done in areas that have already had visible debris cleaned up. Basically, results of this sampling will be in the vein of confirming that clean up was effective rather than estimating what someone's risk might have been if they had already been raking up visible chunks of debris. Is that correct?

Hi All,

As we discussed yesterday during our Planning Meeting, EPA's START contractor is performing Activity-Based Sampling this morning at Sacramento Elementary School. See attached photos. This type of sampling is supposed to replicate activities that a resident might perform, such as raking or mowing their yard, and determining exposure risks. They are wearing personal air samplers. Samples will be sent to Seattle for analysis, and we expect data back by Wednesday, and can inform you on the results as soon as we can.

Thanks,

- Richard
